AGENTIKA 2.0 · NASCON 2026

Witness

AI proposes. A check audits. A human decides.

A decision desk for high-stakes eligibility screening,
where the automated pipeline has no way to deny an application.

THE PROBLEM

A denial has no owner.

01 The autonomous scorer

A model issues approve or deny. It is fast, but a refusal has
no reviewable basis and nobody accountable for it.

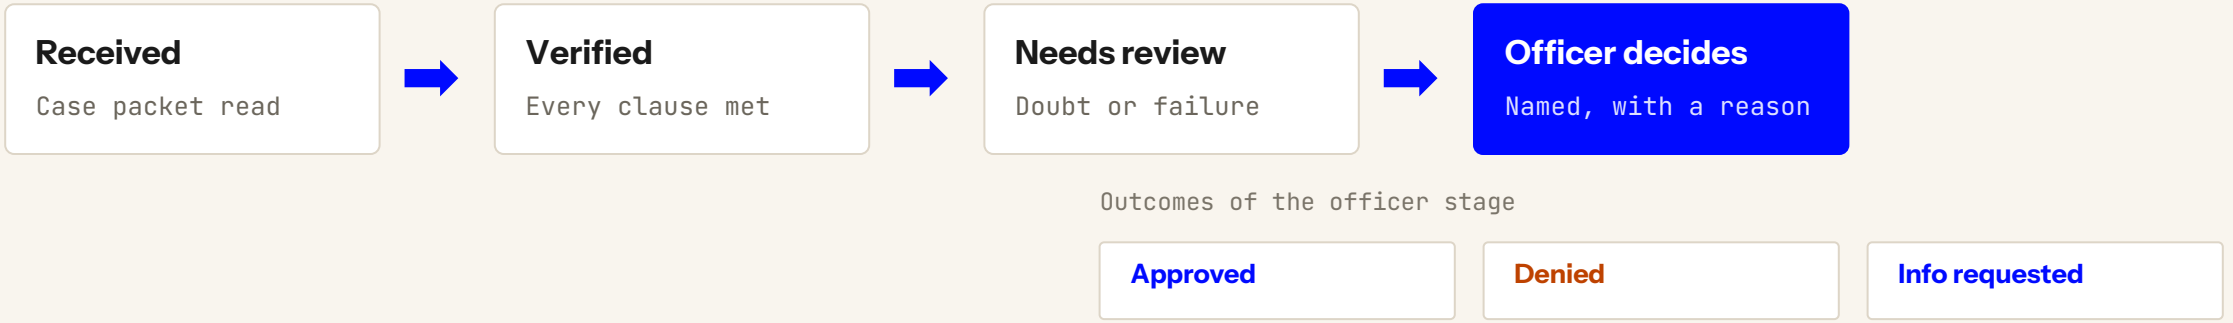

02 The cosmetic reviewer

A person clicks confirm on whatever the model produced.
The human step exists on the diagram but holds no authority.

In benefits screening the cost of error is asymmetric. A wrongly refused applicant loses support, and an automated refusal is the hardest kind to contest.

THE DESIGN RULE

The human is a stage, not a reviewer.

No code path in the automated pipeline writes Approved or Denied.

The lowest state the pipeline can reach is Needs review. A final decision exists only as a recorded human act.

HOW A CASE MOVES

Six steps, one of which is a person.

01

Read

PDF or text becomes citable documents

02

Extract

A model proposes values with quotations

03

Ground

Each quotation is checked verbatim

04

Clauses

Seven rules evaluated in code

05

Verify

An independent check may abstain

06

Decide

An officer records the decision

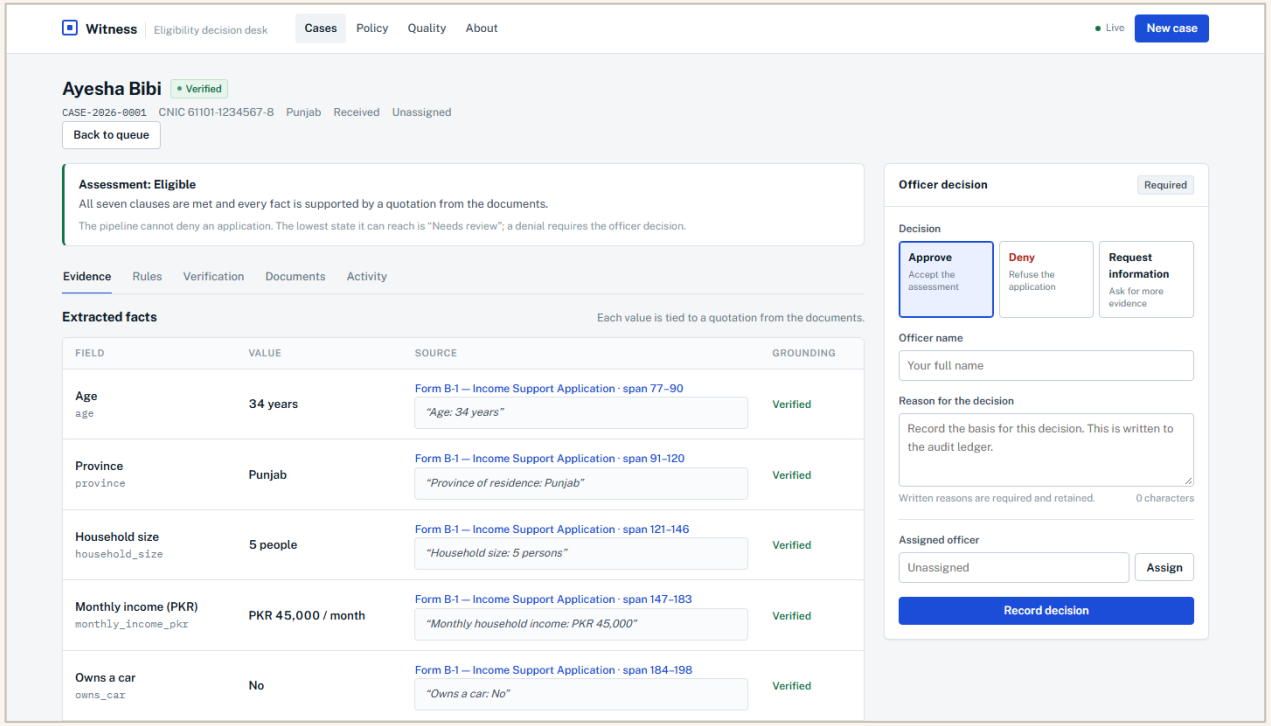

The model may add caution. It cannot remove it: an abstention is always allowed, a failed clause is never cleared.

GROUNDED EVIDENCE

Every value carries the sentence it came from.

The extractor returns a value and an exact quotation. Witness re-reads the quotation against the source document before the value is used.

- A value without a verbatim quotation is not grounded.
- Clicking a source opens the document and highlights the span.
- An invented quotation produces no citation.

Evidence tab, case 2026-0001: value, quotation, source, grounding

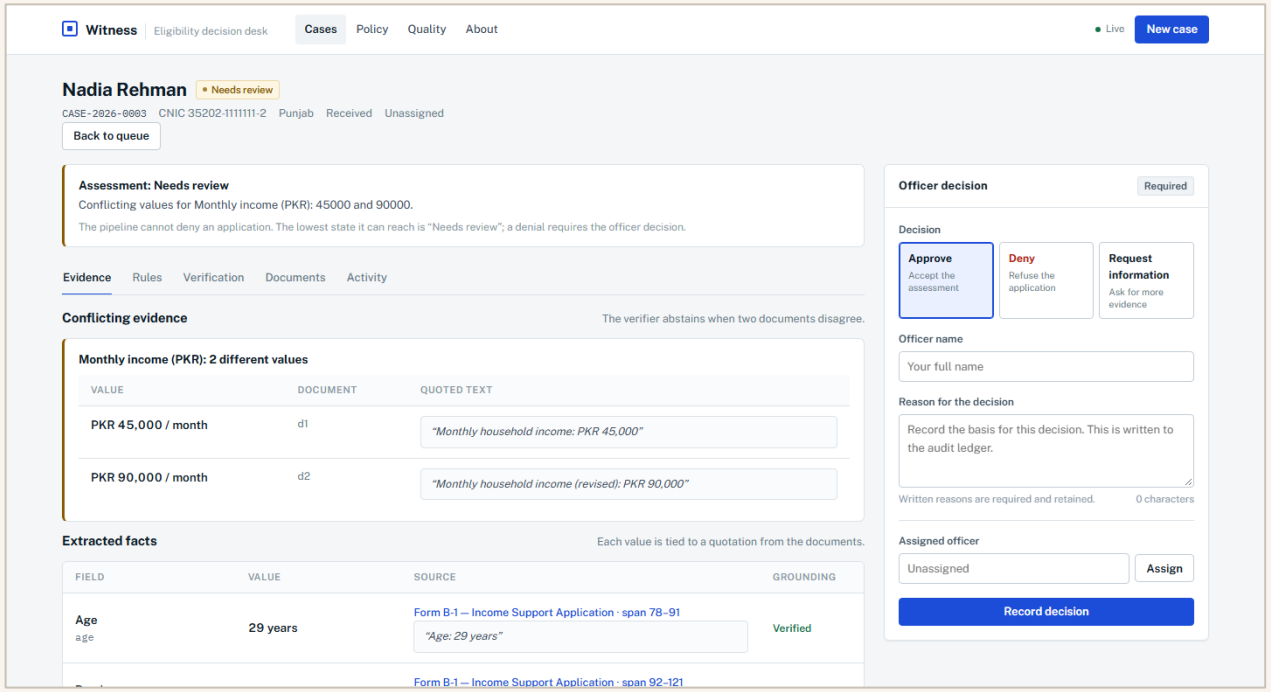

ABSTENTION

The verifier is allowed to refuse.

Three conditions force an abstention:

- Quoted text does not appear in the source.
- The same field holds conflicting values.
- A clause cannot be decided from the evidence.

An abstention is a success, not a failure:
the case reaches the person who can resolve it.

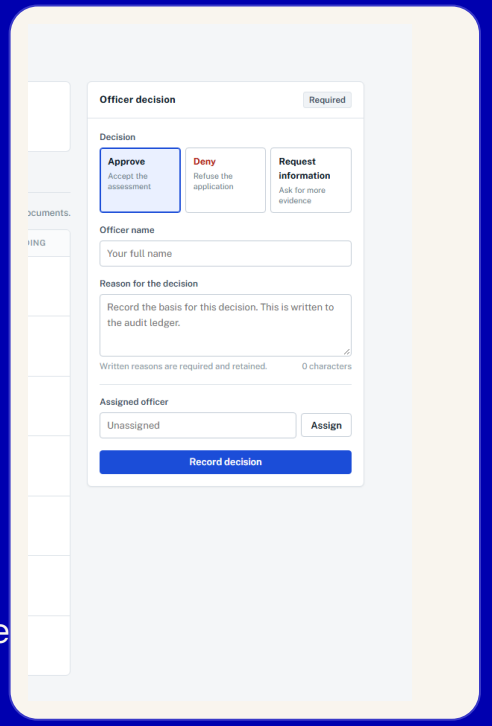

Case 2026-0003: two income figures, both quoted, state stays Needs review

The officer's decision is enforced by the backend.

The interface is not the safeguard. The rules live in the service.

- An officer name is required.
- A written reason is required, and retained.
- Invalid or duplicate decisions are rejected.
- If the ledger cannot be written, the request fails and the case is unchanged.

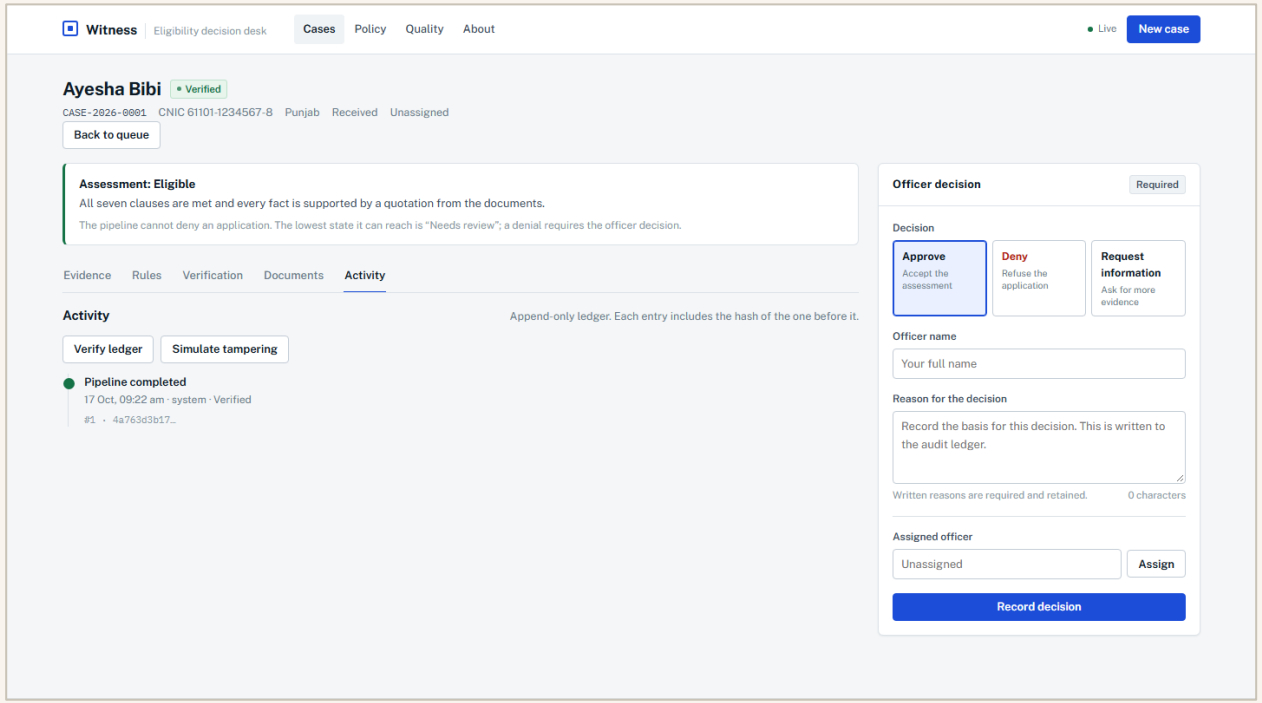

Officer panel: action, name, written reason

An override of an abstention is recorded explicitly, not silently.

ACCOUNTABILITY

Every decision is hash-chained.

Activity tab: append-only entries, verification and tamper simulation

Each entry stores the hash of the one before it.

- Verification recomputes the whole chain.
- A forged copy breaks at the changed entry.
- The real ledger is never modified by the demo.

Integrity is proven. Durability is stated, not implied.

QUALITY GATE

The service checks itself before it serves.

55 / 55
Recorded expectations met

97.1%
Facts with a verbatim quotation

60%
Cases escalated instead of guessed

Holds
No automatic denial, before a human

The gate runs at start-up over a fixed case set. With the strict setting enabled, a failing expectation stops the service from serving requests at all.

7
policy clauses,
each traceable to a written rule

/api/eval · 17 October 2026 · version 0.5.0

DEPLOYMENT

Live on Clouds by Alternate Futures.

One container, one port, one public URL. The model is a dependency with a deterministic fallback, not a single point of failure.

https://alternate-echo-whale-5578-github-app.alternatefutures.ai

status ok · gate all_passed · version 0.5.0

Deployed from a public repository on every commit, with the image tag equal to the commit.

Browser
hash-routed console

Container
FastAPI · port 8000

Model
Groq, with fallback

Ledger
SQLite hash chain

Stated limits

The ledger is local to the deployment: it survives a restart, not a redeploy.

The policy is synthetic and inspired by social protection practice, not official.

Unfamiliar documents abstain rather than guess.

IMPACT AND NEXT

Built for the decision, not the demo.

Who it serves	What is proven now	Next
Social protection agencies screening high volumes	Seven clauses, deterministic and traceable	Configurable policy per programme
Caseworkers who must sign off on each outcome	Grounded extraction with abstention	Durable ledger across deployments
Auditors who need a verifiable trail	Enforced human gate and hash-chained ledger	Officer identity and role separation
	Quality gate in the running service	Exportable decision packs for audit

The design claim is modest and testable: the machine may propose, a check may refuse, and only a named person may decide.

THANK YOU

Witness

AI proposes. A check audits. A human decides.
